

ACQUIRED KNOWLEDGE

Output indicator

Indicator Phrasing

English: number or % of [specify] who passed the provided test

French: nombre ou % de [précisez] qui ont réussi le test soumis

Portuguese: número ou % de [especifique] que passaram o teste providenciado

Czech: počet nebo procento [určete cílovou skupinu], kteří složili poskytnutý test

What is its purpose?

The indicator measures the learning benefits of any knowledge and skills-transfer activities, such as class-based training, demonstrations and awareness-raising sessions. Not only can it be used for a single activity (e.g. training), but also for a sum of different knowledge and skills-transfer activities.

How to Collect and Analyse the Required Data

Determine the indicator's value by using the following methodology:

- 1) **Define a limited number of the most important knowledge or/and skills** that the project participants should gain as a result of the provided support. Avoid having unrealistically high or unnecessarily low requirements by verifying the test's difficulty by **pre-testing** it with at least 10 people.
- 2) **Decide the minimum result a person needs to reach** in order to pass the test (for example, answering correctly at least 7 out of 10 knowledge-related questions and performing correctly at least 3 out of 5 tested skills).
- 3) **Prepare simple tests** assessing whether the targeted project participants have the pre-defined, most important knowledge and/or skills.
- 4) Administer the test to a [representative sample](#) of your target group members by using a combination of:
 - > **a written test** (in the case of literate persons) or **interview** where the data collector asks knowledge-related questions and records whether the participant provided correct answers (in the case

of largely illiterate persons)

> **observations** where the participants are asked to perform the tested skill and the data collector records whether it was performed correctly

5) **Count** whether the participant reached the minimum required result.

6) **Calculate the indicator's value** by dividing the number of participants who attained the minimum required knowledge/skills by the total number of tested participants and multiply the number by 100. For example, 40 participants who passed the test divided by 50 participants who took the test multiplied by 100 equals 80% success rate.

Disaggregate by

1) Always **conduct both a “pre-test” and “post-test”** – otherwise you will not know the extent to which the respondents changed their knowledge and skills.

2) Decide whether to measure the direct effect of a one-off activity (e.g. a demonstration) or the effect of a longer learning process (e.g. series of several trainings over a period of time).

3) If possible, **conduct the “post-test” twice** – once immediately after the “capacity building” activity is completed (showing you the immediate learning) and then 1-2 months later (showing you the knowledge and/or skills which people actually remember and might use). However, **the tests do not need to relate to a single activity only** (e.g. training) – they can be provided during the baseline and endline surveys, assessing the overall change in the target population’s specific knowledge and/or skills.

4) In the case of agricultural activities, use this indicator together with the [Testing of Promoted Practice](#) or [Adoption of Promoted Practice](#) indicators and **check for correlation** between their values.

Important Comments

1) Always **conduct both a “pre-test” and “post-test”** – otherwise you will not know the extent to which the respondents changed their knowledge and skills.

2) Decide whether to measure the direct effect of a one-off activity (e.g. a demonstration) or the effect of a longer learning process (e.g. series of several trainings over a period of time).

3) If possible, **conduct the “post-test” twice** – once immediately after the “capacity building” activity is completed (showing you the immediate learning) and then 1-2 months later (showing you the knowledge and/or skills which people actually remember and might use). However, **the tests do not need to relate to a single activity only** (e.g. training) – they can be provided during the baseline and endline surveys, assessing the overall change in the target population’s specific knowledge and/or

skills.

4) In the case of agricultural activities, use this indicator together with the [Testing of Promoted Practice](#) or [Adoption of Promoted Practice](#) indicators and **check for correlation** between their values.
